

CRYPTO WORLD'S FAIR · SOLAMI SIDETRACK

solana-pulse

Real-time Solana on-chain monitor. Reads the chain live, turns balance changes into clean SOL & SPL-token flows, and fires alerts to your terminal, a webhook, Telegram, and a live dashboard.

Node 20

@solana/web3.js

SSE

MIT

Runs on mainnet

github.com/Bandidozx/solana-pulse

PROBLEM

- Watching a wallet or program for large moves usually means polling RPC or writing throwaway scripts.
- Public endpoints rate-limit hard — you can't just stream everything at full rate.
- Decoding every instruction for every program is fragile and doesn't generalize.

SOLUTION

A small service you point at any program and get live, readable alerts out of — without decoding a single instruction.

Read flows, not opcodes

Computes SOL + SPL deltas from transaction meta, so it works across programs.

Built for real chains

Bounded concurrency, drop-oldest queue, 429 backoff. A slow RPC can't kill it.

LIVE DEMO

The dashboard streaming real mainnet alerts, and the terminal log behind it.

`npm start` → dashboard on `localhost:8787`

```
ALERT token_whale | in 7,935,483 mint=3sptU... sig=5skxp...  
ALERT token_whale | out 7,952,946 mint=3sptU... sig=5skxp...  
ALERT token_whale | in 5,675,158 mint=5h3p4... sig=23bkv...
```

Every alert carries the signature, so you jump straight to the transaction on an explorer.

HOW IT WORKS

WHAT SHIPS TODAY

- Program log subscription + bounded-concurrency fetch queue
- SOL & SPL balance-delta parsing, whale thresholds, per-mint filters
- Dedupe window, 429 cooldown, health endpoints
- Delivery: stdout, JSON webhook, Telegram
- Live SSE dashboard
- Tests: `npm test` — 6/6 passing

WHY SOLAMI

The whole design is built for exactly what Solami sells: private RPC, the gRPC firehose, webhooks, and fast landing.

- On a public endpoint it **samples** to survive the rate limit.
- Point `SOLANA_RPC_URL` / `SOLANA_WS_URL` at Solami and it runs the full, un-sampled stream.
- Next: consume the Yellowstone gRPC firehose directly for full throughput.

ROADMAP

- gRPC (Yellowstone) ingestion instead of `onLogs`
- Address-level watchlists (alert on a specific wallet, not just magnitude)
- Rule editor + persistence in the dashboard
- Historical backfill and daily flow summaries
